## THE TRANSPARENCY CHALLENGE

The lack of transparency

As recent publications and newspaper articles have highlighted, transparency remains one of the main challenges in success and trust in carbon projects. Fully true or not, the reported lack of accountability has a significant impact on the carbon project market.

The role of transparency

As carbon project consultants, working from initiation to credit sale and managing projects from tree to customer, we at FORLIANCE have realized that bridging the communication gap between project developers and corporations is critical to the success of carbon projects.

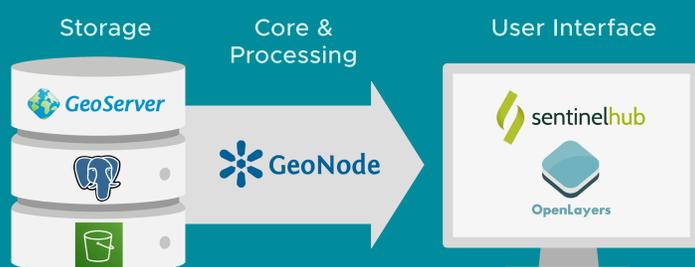

## OUR WEB & MOBILE APPLICATION

Our platform visualizes data to guide project tracking and management as a web and mobile application. A role-based access control account is used for log-in to view a specific project site. For every project, data is input to our in-house developed modules to produce key performance indicators relevant to the specific project.

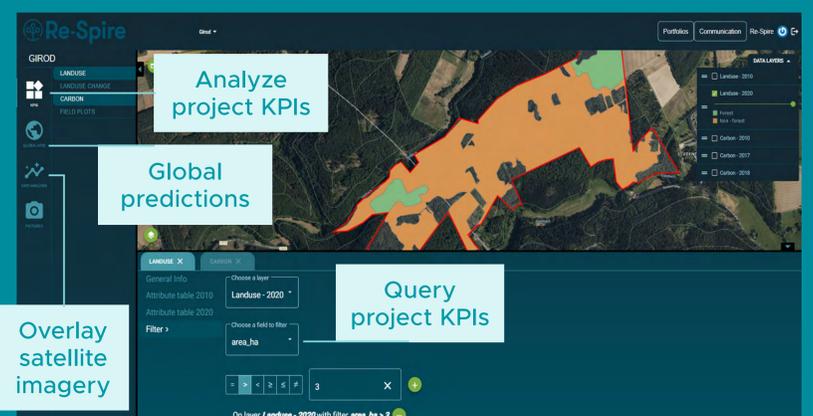

How we do it
